

# Sports & Activity Venue Management Platform

A multi-tenant vertical SaaS that runs an entire sports or activity venue from one product — bookings, memberships, packages, CRM, cafe & retail POS, equipment lending, promotions, a unified payment ledger, and a no-code public booking website — replacing the four-to-six disconnected tools a venue would otherwise stitch together.

## AT A GLANCE

### CHALLENGE

A venue is several businesses at once — scheduler, biller, shop, cafe, equipment desk, CRM, website — each usually a separate tool. The result: no single customer view, no single ledger, untracked no-show losses, and no safe delegation.

### SOLUTION

A multi-tenant vertical SaaS built on two ideas — a booking spine that produces transactions and a customer hub that collects them — plus one reused checkout engine across every selling surface. 17 modules, one product.

### RESULT

Four-to-six disconnected tools consolidated into one governed system: every revenue stream in one ledger, every customer in one 360° view, self-service online booking, and role-based delegation with a full audit trail.

### 4–6 → 1

Disconnected tools consolidated into one platform

### 17 modules

Across scheduling, commerce, people & system

### 1 checkout

Reused across every selling surface

### Multi-tenant

Per-venue subdomain, branding & data

### CHALLENGE

## One venue, six disconnected tools

A five-a-side football centre, a martial-arts academy, a padel club, a leisure centre — each is really several businesses at once, and off-the-shelf each is a separate system:

- **4–6 disconnected systems.** A booking calendar, a card terminal, a members spreadsheet, an equipment list, a website — none talk to each other.
- **No single customer view.** Classes, membership, cafe tab, and shop purchases live in different tools, so nobody sees what a customer is worth — or owes.
- **No single ledger.** Revenue arrives through bookings, memberships, packages, cafe, retail, and lending, with no one place it all settles.
- **Revenue leaks.** No-shows and late cancellations go untracked; cash debts are forgotten; refund policy is inconsistent.
- **Manual online presence.** A bookable website usually means hiring a developer; most venues make do with phone-and-DM booking.
- **No safe delegation.** Owners can't give reception or coaches limited access without handing over the keys — and there's no audit trail.

**SOLUTION**

## One platform, two ideas, one checkout

A multi-tenant vertical SaaS platform. Each venue signs up as its own tenant — branded space, subdomain, staff, settings, and data — and runs everything from one dashboard. It hangs together because of two structural ideas and one reused component.

- **The booking spine.** A reusable *Booking Option* becomes a *Booking*, which spawns dated *Occurrences*, each filled with *Participants*, each producing a *Payment*. Options are Joinable (classes: seats, per-seat) or Creatable (rentals: duration×rate, split/custom pay).
- **The customer hub.** Everything links to a CRM customer and every charge lands in one Payment Logs ledger — giving a true 360° view of spend, debt, and relationships, rolled up in analytics.
- **The unified checkout engine.** The same checkout backs memberships, packages, cafe, shop, and bookings — checkout as customer/guest, apply discount, pick payment method — so all modules feel like one product.
- **Commerce & operations.** Recurring memberships (proration, auto-renew), prepaid packages, cafe/shop POS with inventory & tabs, equipment lending, a discount engine, multi-location scheduling, peak-hour pricing, and per-participant attendance.
- **Governance & growth.** Per-module RBAC + audit log, tiered cancellation/refund + no-show debt tracking, a no-code public booking microsite, and Stripe/Terminal/links/cash/bank payments with tax and accounting sync.

### Architecture at a glance

```
Multi-tenant: each venue → own subdomain, branding, staff & data
Single-page dashboard: Overview · Operations · Programs/Commerce · People · System (17 modules)
├─ Shared services: unified checkout engine · unified payment ledger · customer hub (CRM 360) · notifications
├─ Integrations: Stripe + Terminal (online / links / card readers) · Google Calendar · accounting sync · email
Data model: Booking Option → Booking → Occurrence → Participant → Payment | everything → CRM + Payment Logs → Ana
Hosting: AWS Amplify
```

### Technology & capabilities

## THE PLATFORM

# Architecture, spine & checkout

Original architecture diagrams — no client screenshots or data reproduced.

System architecture — a multi-tenant SPA whose modules sit on shared platform services (checkout, ledger, CRM, notifications) and external integrations.

The booking spine produces transactions; the customer hub collects them into one ledger and 360° view; analytics rolls them up.

One reused checkout engine backs every selling surface — so all revenue lands in one ledger and updates the same customer view.

**RESULT****The whole venue, in one system****One ledger**

Every revenue stream settles & rolls up in one place

**Customer 360**

Spend, debt & relationships per customer

**Self-service**

No-code public booking site per venue

- **Consolidation.** Four-to-six disconnected tools replaced by one product, so a single booking, customer, or payment flows through one consistent system.
- **Every revenue stream in one ledger.** Bookings, memberships, packages, cafe, retail, and lending all settle into one Payment Logs view and roll up into analytics.
- **A true customer 360.** Because everything links to the CRM, the venue sees total spend, debts, and relationships per customer.
- **Self-service revenue.** A branded, no-code booking site lets customers book and pay online — and captures enquiries straight into the CRM.
- **Operational control.** Per-module RBAC and a full audit trail for safe delegation; tiered refunds and no-show debt tracking to recover real losses.

**Note on scope.** Module counts reflect the delivered product. Client identity, product name, brand assets, tenant data, and commercial metrics are excluded under NDA; outcomes here are described qualitatively.
